

best_move(colour, board)

The best move is depends on the position of the square. We use a scoring system to define which square is the best move. The more powerful the square is (corners, edges), the more points it will add. And there are also squares we should avoid to take whenever possibe(square around the corners), the worse the square is, the more points it will deduct. We will then compare the scores of the squares to decide which square is the best move.
